

INTENSIVE. EXPERT. STROKE REHABILITATION

After a stroke, individuals can experience a wide range of physical, cognitive and/or mood and behavioral difficulties. **Our brain injury rehabilitation experts use evidence-based practices and techniques such as neuromuscular re-education, cognitive retraining, visual-perceptual retraining, articulation, and swallowing programs** that reduce the effects of common stroke symptoms.

With an emphasis on **fall prevention and risk mitigation, rehabilitation goals are identified through interdisciplinary collaboration** between the patient, family, and rehab team, which is comprised of physiatrists, rehab psychologists, nurses and therapists.

PROGRAM FEATURES

- An intensive, individualized treatment plan with ongoing evaluations
- A combination of PT, OT, SLP, Social Work, Psychology, Cognitive Rehabilitation, and Case Management
